

What is a

Distributed Disaggregated Chassis?

Traditional Chassis

Commonly referred to as **monolithic chassis**, it comprises of line cards, fabric cards, control cards, and protocol software.

Often requires proprietary hardware and software components with fixed physical size.

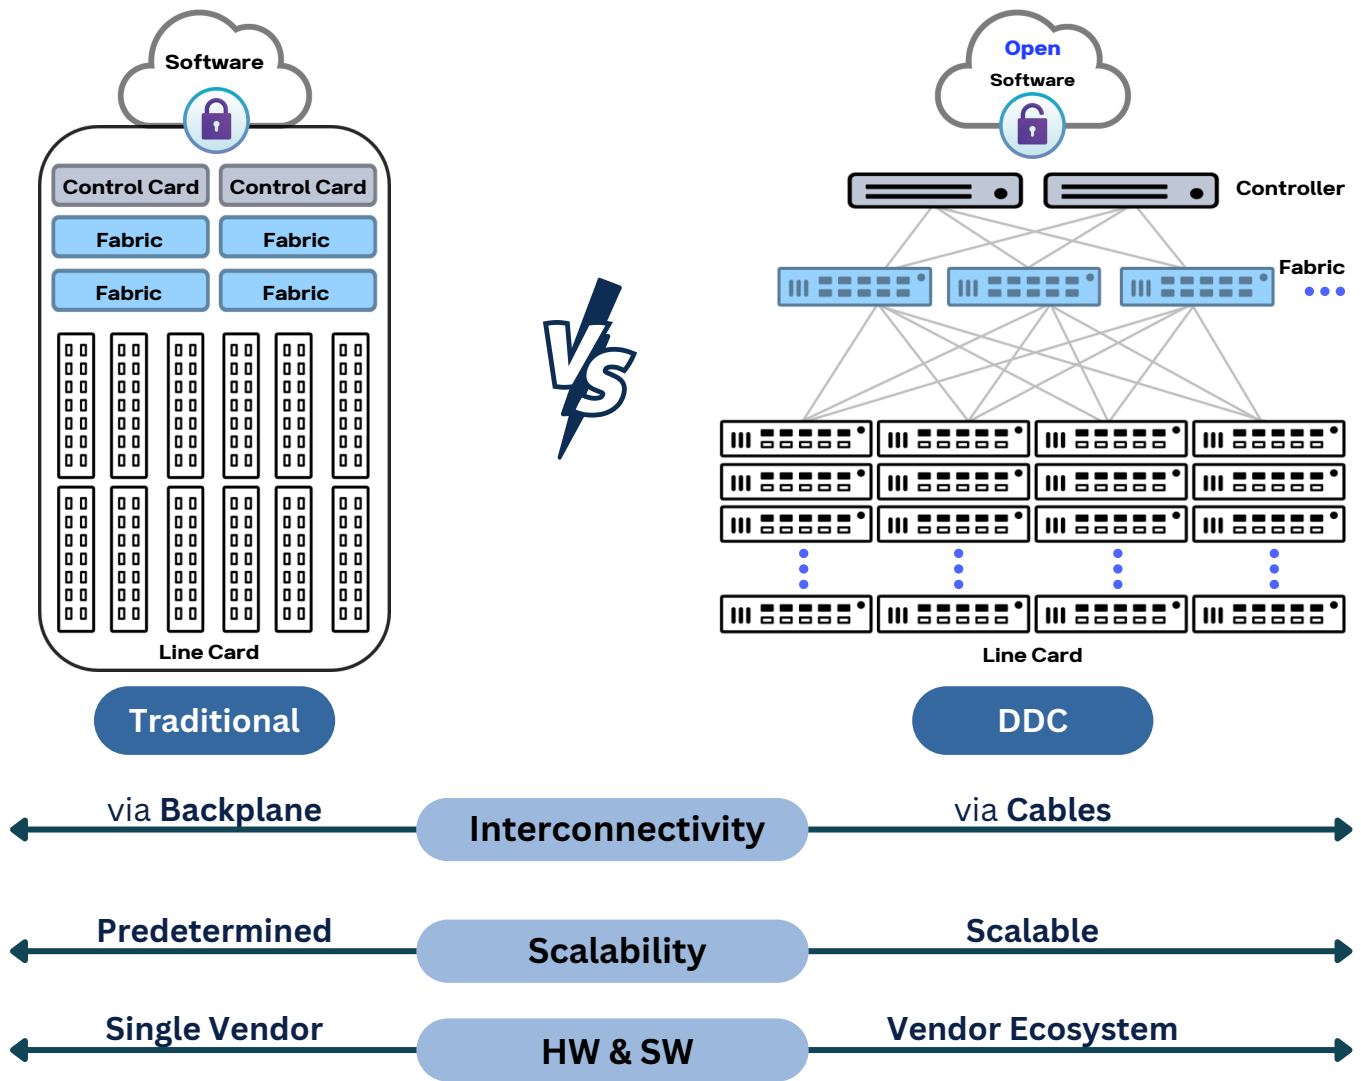

Distributed refers to when switching/routing components are **distributed into standalone boxes**, each with its own power supplies, cooling fans, CPU, chipsets, and protocol software for specific functions.

Distributed Disaggregated Chassis

Disaggregated refers to the **separation** of hardware and software.

Despite the distribution of components, there is a centralized control plane that manages and orchestrates the functions of the distributed elements as **one single virtual chassis**.

Traditional & DDC Comparison

DDC Software Advantages

1. Resilient Software Architecture	2. Ease of Management	3. Telco-grade availability
<ul style="list-style-type: none"> Cloud Native Containerized microservices 	<ul style="list-style-type: none"> Managed as single node 	<ul style="list-style-type: none"> Distributed HW & SW prevent single point-of-failure
<ul style="list-style-type: none"> Dynamical services deployment 	<ul style="list-style-type: none"> Automated network orchestrator 	<ul style="list-style-type: none"> Failover protections to ensure non-stop services
<ul style="list-style-type: none"> Multiple application scenarios 	<ul style="list-style-type: none"> Zero Touch Provisioning 	<ul style="list-style-type: none"> <50ms fast-reroute for unicast & multicast networks

Benefits of UfiSpace DDC

Lower TCO

Higher Capacity

Reliability

Openness

Empower Your Network for the Future with UfiSpace DDC Solutions
